Iam0ti

Smart Contract Security Researcher · Protocol Engineer

iam0ti@proton.me · GitHub · LinkedIn · @IAM0TI · Sherlock · Blog

SUMMARY

Independent smart contract security researcher and protocol engineer. Identified **50+ validated vulnerabilities** across 18+ competitive audit contests on Sherlock, Cantina, and CodeHawks — spanning DeFi AMMs, cross-chain bridges, yield vaults, lending protocols, and oracle systems. Architects production smart contract systems across Solidity (EVM), Sui Move, Stellar Soroban, and Noir zero-knowledge circuits.

PROFESSIONAL EXPERIENCE & AUDIT TRACK RECORD

Independent Smart Contract Security Researcher Jan 2025 - Present

Sherlock · AnomX (team) · Cantina · CodeHawks

- Secured **1st place** in Rain (Sherlock), **3rd** in Allbridge Core Yield, **5th** in Yield Basis, and **6th** in Clear Macro / Superfluid, as measured by leaderboard rank, by identifying critical exploit paths including share inflation attacks, incorrect gauge emission accounting, and ERC-4626 compliance violations.
- Discovered 3 High and 7 Medium-severity vulnerabilities in the DODO Cross-Chain DEX contest, exposing unauthorized cross-chain refund claims, protocol fund theft via reverted bridge transactions, and swap execution bypass vectors.
- Achieved Cantina top-25 placements in Mezo (20th), Mighty (25th), Colorpool (20th), Velvet, and Mystic. Filed 11 findings on CodeHawks RAAC Core (4H, 6M, 1L) targeting reward manipulation, NFT lockups, and debt normalization errors.

Lead Smart Contract Engineer — IFÁ Labs Feb 2025 - Sep 2026

GitHub · Production multi-chain oracle deployed on Base, Mantle, AssetChain, Hedera, Sui

- Authored all on-chain code (9 of 11 organization repositories): price feed contracts, verifiers, an oracle-based AMM DEX (IfaSwap), Sui Move oracle port, multi-asset swap pool, and faucet infrastructure.
- Integrated Chainlink CRE by building a `ReceiverTemplate`-based verifier that validates attested reports from the decentralized forwarder, enforcing workflow identity, owner address, and trusted caller checks.
- Designed IfaSwap with a novel USD-value invariant, EIP-2612 permits, and oracle staleness guards. Ported the oracle system to Sui Move, solving the absence of signed integers via capability-based permissioning and unsigned decimal arithmetic.
- Remediated all findings from an external security audit across the EVM oracle contract suite.

Smart Contract Developer — Web3Bridge (Cohort) Aug 2024 – Dec 2024

Blockchain engineering program · Solidity · Hardhat · Foundry

- Shipped production cohort projects: AsoOke Marketplace (on-chain fashion commerce), TutorPal (decentralized tutoring marketplace), and SonikDrop (Merkle-based airdrop platform — lead contract developer).

Cyber Security Intern — Senselearner Technologies Sep – Nov 2023

- Conducted web application penetration testing using Nmap, Wireshark, Nessus, and Burp Suite; authored vulnerability assessment reports with remediation recommendations. (Certificate)

SELECTED ENGINEERING PROJECTS

PayV — Zero-Knowledge Private Payments Solidity · Noir ZK · Poseidon2 · Go · Foundry

- Engineered a privacy-preserving payment protocol on Mantle by implementing a 32-level Incremental Merkle Tree (Poseidon2 hashing) with a historical root ring buffer for asynchronous proof verification, integrated with Noir UltraHonk verifier contracts enforcing nullifier-based double-spend prevention and reentrancy-safe relayer fee distribution.

CRE Private Market — Confidential Prediction Market AMM Solidity · Go · Chainlink CRE · AES-256-GCM

- Built a binary prediction market with off-chain confidential AMM and on-chain settlement via Chainlink CRE: designed `BinaryFPMM.sol` with `CreProxyControlled` access guard and 1,074 lines of Foundry tests across 13 suites. Implemented the Go AMM engine (buy/sell math, MasterChef-style fee accumulator) with deterministic AES-256-GCM encryption using HMAC-SHA256 nonce derivation for DON consensus compatibility.

Rialto — Stateless Soroban Settlement (x402 Protocol) Soroban · Stellar · BTT

- Authored a stateless Soroban smart contract enforcing HTTP 402 spending caps on Stellar with single-use payment authorizations, auto-revocation, zero contract storage rent, and G-account/C-account polymorphism. Wrote 574 lines of Branching Tree Technique tests. Deployed to Stellar testnet.

NFTLend-Diamond — P2P NFT-Collateralized Lending Solidity · Foundry · EIP-2535

- Architected a modular P2P lending protocol using the EIP-2535 Diamond standard with facets for loan origination, competitive offers, interest/repayment calculation, liquidation, ERC-721 receipt tokens, and whitelist-based access control. (GitHub)

Additional: Heterogeneous Oracle Swap (Sui Move — multi-asset pool with Asset Sweep via PTBs) · Merkle Airdrop (Solidity/Hardhat — on-chain proof verification) · SonikDrop (Solidity — airdrop platform) · MinTify (Solidity — NFT minting) · JAB (Python — PoW blockchain: UTXO, ECDSA, Merkle trees)

SKILLS & INTERESTS

Languages	Solidity, Soroban (Rust), Python, Go, Sui Move, Noir, Bash, Yul
Blockchain & Security	EVM internals, Smart contract auditing, Foundry, Hardhat, Slither, Chainlink (CRE/VRF/Oracles), DeFi protocol security, Soroban/Stellar, ZK circuits (Noir/Poseidon2), AMM design
Architecture	ERC-2535 Diamond, ERC-4337 Account Abstraction, UTXO model, Merkle trees, Proxy patterns (UUPS, Transparent), Cross-chain settlement, Oracle systems
Systems & CS	Computer architecture (Nand2Tetris CPU), Cryptography (ECC, modular arithmetic, CRT), Networking, Linux, Penetration testing (Nmap, Burp Suite)
Interests	Blockchain, Distributed Systems, Smart Contracts, Program Analysis, Zero-Knowledge Systems, Cryptography, Software Correctness, Low-Level CS (Compilers, OS Internals)

EDUCATION

Obafemi Awolowo University 2022 – Dec 2027 (Expected)

Bachelor of Science in Computer Science with Mathematics

INDEPENDENT RESEARCH & DISTINCTIONS

- **3rd place — HackenProof × BlockZ** security contest.
- **Team Rank 30 — PicoCTF 2024** (group leader, OTI404).
- Built a **16-bit CPU and ALU from NAND gates** (Nand2Tetris, HDL) and **first-principles cryptographic primitives** in Python: Extended Euclidean Algorithm, Euler's Totient, Chinese Remainder Theorem, and modular exponentiation.
- **Certifications:** Cisco — Networking Basics, Network Support & Security.
